

iPhone 4s – Screen Replacement (iFixit: <http://tinyurl.com/jvh2vso>)

Notes (read these each and every time, it is easy to forget a few of these items):

- Use a clean sheet of paper to do the tear down on, put this part sheet off to the side & DON'T bump it.
- There is not a spot on this part sheet for the back cover or the battery.
- I don't remove the plastic ring in step 12, it always seems attached very well.
- In step 22 & 30, I leave the tape attached to the tweezers I used to pull it off.
- In steps 17 / 24 watch for the little rubber piece (it is under the digitizer and LCD cable from step 17).
- Don't forget to transfer the ear piece mesh from your old screen to your new screen (x-acto helps).
- Watch for the small clear plastic ring on the back of the screen, it is for the front camera. Transfer it.
- Don't forget to peel the film off the back of the new screen just before install.
- In step 37 you must make sure the digitizer and LCD cables are pulled completely through the frame.

i don't remove these screws and washers, i just loosen them
